

### AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application.

#### Listing of Claims

Claim 1 (Previously Presented): A method of leaching a metal value from a heap of a metal-containing ore, which method includes the steps of:

- (a) establishing a downward flow of a leach liquor through a section of the heap by supplying the leach liquor onto a top surface of the section and allowing the leach liquor (containing metal values in solution) to drain from a lower part of the section, and
- (b) supplying the leach liquor onto the top surface of the section at a flow rate that is sufficient so that the downwardly flowing leach liquor saturates the section of the heap.

Claim 2 (Original): The method defined in claim 1 wherein step (a) includes establishing a plug flow of the leach liquor through the section of the heap and step (b) includes supplying the leach liquor at a flow rate that maintains the plug flow of the leach liquor and maintains saturation of the section of the heap.

Claim 3 (Original): The method defined in claim 2 supplying the leach liquor in step (b) by supplying the leach liquor as a downwardly flowing curtain that contacts the top surface of the heap as a line or a narrow band that extends across the top surface and moving the curtain along the length of the section of the heap continuously or in a series of steps.

Claim 4 (Original): The method defined in claim 3 wherein the curtain is continuous across the top surface of the heap.

Claim 5 (Previously Presented): The method defined in claim 1 further including supplying the leach liquor in step (b) at a flow rate that is greater than  $15 \text{ l/hr/m}^2$  of the top surface of the section.

Claim 6 (Original): The method defined in claim 5 wherein the flow rate is greater than  $20 \text{ l/hr/m}^2$  of the top surface of the section.

Claim 7 (Previously Presented): The method defined in claim 6 wherein the flow rate is greater than  $25 \text{ l/hr/m}^2$  of the top surface of the section.

Claim 8 (Previously Presented): The method defined in claim 1 wherein step (b) includes supplying the leach liquor for a relatively short time period compared with typical time periods for supplying leach liquors to heaps using known sprayer/sprinkler systems and drip systems.

Claim 9 (Original): The method defined in claim 8 wherein the time period is less than 4 hours per 24 hour period.

Claim 10 (Original): The method defined in claim 8 wherein the time period is less than 3 hours per 24 hour period.

Claim 11 (Previously Presented): The method defined in claim 8 wherein the time period is less than 2 hours per 24 hour period.

Claim 12 (Previously Presented): The method defined in claim 1 further including supplying the leach liquor in step (b) via a distributor that can be moved over the surface of the heap.

Claim 13 (Previously Presented): The method defined in claim 1 further including retaining and minimising run-off of the leach liquor supplied onto the top surface in step (b) by positioning a barrier on the top surface of the heap.

Claim 14 (Previously Presented): The method defined in claim 1 further including retaining and minimising run-off of the leach liquor supplied onto the top surface in step (b) by forming a series of furrows or other suitable troughs for leach liquor, and wherein step (b) includes supplying the leach liquor into the furrows.

Claim 15 (Withdrawn): A heap leaching operation that includes:

- (a) a heap of a metal-containing ore; and
- (b) a leach liquor distributor for supplying leach liquor onto a top surface of a section of the heap at a flow rate that is sufficient so that the downwardly flowing leach liquor saturates the section of the heap.

Claim 16 (Withdrawn): The heap leaching operation defined in claim 15 wherein the distributor is a track mounted header pipe with a series of spaced-apart, spray outlets or an elongate slot outlet.

Claim 17 (Withdrawn): The heap leaching operation defined in claim 16 wherein the distributor is positioned so that the header pipe extends across the top surface of the heap and can be moved continuously or in the series of steps across the section of the heap and can supply the leach liquor as a curtain onto the top surface of the heap.

Claim 18 (Withdrawn): The heap leaching operation defined in claim 15 further including a cover above the top surface of the heap and wherein the distributor includes a network of header pipes attached to the underside of the cover with a series of spaced-apart spray outlets, such that leach liquor may be applied to the top and side surfaces of the heap.

Claims 19 – 20 (Cancelled).

Claim 21 (New)      A method of leaching a metal value from a heap of a metal-containing ore, which method includes the steps of:

- (a)    establishing a downward flow of a leach liquor through a section of the heap by supplying the leach liquor onto a top surface of the section and allowing the leach liquor (containing metal values in solution) to drain from a lower part of the section;
- (b)    supplying the leach liquor as a downwardly flowing curtain that contacts the top surface of the heap as a line or a narrow band that extends across the top surface at a flow rate that is sufficient so that the downwardly flowing leach liquor saturates the section of the heap, wherein the line or narrow band is less than 1 m wide; and
- (c)    moving the curtain along the length of the section of the heap continuously or in a series of steps.
